WELLS.

TWENTY FIRST ANNUAL REPORT  
OF THE  
VISITORS  
OF THE  
SOMERSET COUNTY LUNATIC ASYLUM :  
PRESENTED TO THE  
COURT OF QUARTER SESSIONS,  
HELD AT TAUNTON, IN THE SAID COUNTY, ON TUESDAY THE  
FIFTH DAY OF JANUARY, 1869.

---

During the year 1868, the Admissions, especially the females, and the Discharges, have been greater than in any previous year, and the proportion of Recoveries unusually high.

Every effort has been made to provide sufficient accommodation, by converting the space in the roof into bedrooms. The Committee are thankful to be able to state that the Asylum has still continued free from any infectious disease.

Upon Dr. Boyd's retirement, and Dr. Medlicott's taking charge of the Asylum, several improvements were made in the interior, which appear to have had a beneficial effect on the patients, who are on the whole more tranquil than they used to be.

These improvements could not in justice to Dr. Medlicott be postponed, and took some time to finish. The completion of the West Wing was, therefore, delayed, as the carpenters were employed elsewhere. The West Wing is now ready for the reception of patients.

On the north side of the Dining-Hall, between the staircases which are to lead to the new Chapel, a small extension of the Hall has been made to contain the things necessary for the musical, and other entertainments given periodically to the patients, and of which Dr. Medlicott reports as favourably as Dr. Boyd did.

It was found that the Hall, large as it is, was barely big enough to contain the patients at dinner, and it was necessary to make the alteration, before the approaches to the Chapel were begun, which have been postponed in consequence, but will be begun as soon as the probability of frost is over.

The new works for a better supply of water, sanctioned at the October Sessions, are in progress, and Messrs. Easton and Amos will complete them as speedily as possible.

The contract with the City of Bath has been continued for five years on the same terms as before.

Dr. Bath who was appointed Assistant Physician shortly before Dr. Boyd's resignation, has lately resigned.

Mr. Hill who has been from the opening of the

Asylum Head-Attendant on the male side, and had the confidence of the Superintendent, and the Committee, has recently died in the Asylum, after a short illness.

Mrs. Lucas also died some months back, who has had charge of the Dairy from the opening of the Asylum.

The Committee have every reason to be satisfied, so far that in appointing Dr. Medlicott, they have secured the services of a most efficient Superintendent, and have to report their satisfaction with the other officers and attendants.

# TWENTY FIRST ANNUAL REPORT

OF THE

## SOMERSET COUNTY LUNATIC ASYLUM

FOR THE YEAR 1868.

---

BY C. W. CARTER MADDEN MEDLICOTT, M.D.

RESIDENT PHYSICIAN AND SUPERINTENDENT.

---

The Medical Superintendent has the honour to submit to the Committee of Visitors, the Twenty First Annual Report.

On the 31st December, 1867, the numbers in the Asylum were, 223 males ; 220 females ; total 513.

The Admissions during the year have been 103 males ; 127 females ; total 230.

The Discharges during the year have been 54 males ; 81 females ; total 135 ; of these 47 males, and 69 females have been discharged " Recovered." Total 116.

The Deaths during the year have been 40 males ; 32 females ; total 72.

The average population during the year has been 233 males ; 301 females ; total 534.

The numbers in the Asylum this day (31st December, 1868) are 232 males ; 301 females ; total 533. Four males, and three females, out on probation.

In reverting to the chief occurrences of the past year, special attention may be drawn to the unusually large number of Admissions, and of acute cases of insanity

under treatment. There have also been a considerable number of cases, which if not actually moribund on admission, were in such a feeble and emaciated condition, as to require urgently the unsparing use of a generous and stimulant treatment.

Perhaps no one doctrine should be more widely promulgated in the present day, than the exhaustive nature of insanity.

With such an admission, and acknowledging its decidedly asthenic character, it will be readily understood that the indications for treatment most unmistakeably preclude the idea of so-called depletive measures. This might hardly be deemed worthy of record here, but that unfortunately cases have been sent to the Asylum, in which bleeding, cupping, and other lowering measures had been practised before admission. As a conviction based on these considerations, the treatment pursued has been, as heretofore, the adoption of a liberal and stimulant dietary.

In fact, when we consider the "wear and tear" to which the tissues are subjected, as exemplified in cases of acute Mania, or even in irritable and extremely anxious Melancholia, cases in which the constant state of "*qui vive*" or watchful restlessness, seems to waste the tissues faster than they can be nourished, it needs no great sagacity to perceive the soundness of the policy that endeavours to conserve to the utmost any available or residual strength, and yet meets the great demand on the impoverished system, by periodical and regulated supplies of nourishing diet and stimulants.

There cannot be a doubt, that a large number of the effete chronics who annually swell our admissions from the workhouses, become noisy and troublesome owing to a defective dietary: and were this fact more generally recognised, it might tend to counteract the severely economic considerations, which too often prevail at the councils of boards of guardians, more especially as affecting the aged and infirm.

Granted that the hygienic conditions surrounding the insane in our Asylums are all that can be desired, a variety of causes exist that offer formidable obstacles to the Physician in his treatment towards mental restoration, and at the same time tend to increase his bills of mortality. The special attention of the Visitors may be drawn to the large number of cases during the past year presenting on Admission a decided constitutional taint, and in whom severe complications of diseases co-existed. So far from the preternatural excitement of patients affording any indication of strength, it has often occurred that a tolerably robust exterior has masked the latent organic disease of heart or lungs, which physical diagnosis at the bed-side has alone detected. The preternatural excitement so often exhibited in cases of insanity, bears a strong resemblance to the violence and sham strength seen in convulsions. "A man in a convulsive fit is not strong, though six men cannot hold him."

The intimate connection that exists between mental disorder, and bodily disease, has frequently been alluded to in former reports. Indeed the records of the Pathological Case-Books in this institution point in a remarkable manner to the number of organic lesions complicating the cases of insanity. Irrespectively, however, of those not actually fatal, there are a number of chronic cases in the Asylum, in which from the above-named causes, convalescence has been retarded, and which only act as burdens to the institution, to the exclusion of more recent, and, therefore, more curable cases.

The Statistical Tables that have been introduced into this Report, are prepared according to a form recommended by the Commissioners in Lunacy.

"The importance (observe the Commissioners) of adopting in all Asylums a uniform system of statistical tables and registers has long been felt by us, and we are glad to find that the subject has recently been again under the consideration of the Medico-Psychological Association, at whose last meeting a committee to whom it had been referred submitted forms of tables which were

adopted and recommended for general use. These tables, confined to medical statistics, are simple in form, and only include the main and most important facts required to constitute a basis for more elaborate and detailed information."

"The Superintendents of most County Asylums publish in their Annual Reports tables more or less elaborate, and containing a large amount of valuable information. While, however, the facts recorded may be identical in many, if not most of the Reports, the form in which they are recorded varies so greatly that it becomes impossible to tabulate them for the purpose of showing general results."

"In any future legislation it would no doubt be desirable, as suggested in the Report alluded to, so to revise the present 'Registry of Admissions' as to include some of the more important particulars required, in order to obtain correct statistics of insanity. But in the meantime we trust, with the view of facilitating statistical comparison, the Visitors and Superintendents of all institutions for the insane will not object to adopt the forms of tables recommended, which will be found in Appendix (I).

Table I. gives the numbers of Admissions, Re-admissions, Discharges, and Deaths, with the average numbers resident during the year; the sexes being distinguished under each head.

Table II. gives the same results for the entire period the Asylum has been in operation.

Table III. furnishes a history of the yearly results of treatment since the opening of the Asylum.

The table also embraces a column for the mean population, or average numbers resident in each year. In other columns are shown for each year the proportion of recoveries calculated on the Admissions; and the mean annual mortality, or the proportion of Deaths, calculated

on the average numbers resident. It is of the first importance that these two principal results under Asylum treatment, when given, should be calculated on a uniform plan, and according to the methods here pointed out.

Table IV. gives a history of each year's Admissions; how many, for example, of the patients admitted, say in 1855, have been discharged as cured, how many have died, and how many remain in the Asylum in 1865.

The value of this table in regard to the vexed question of the increase of insanity is evident. The table is adopted from the Somerset Asylum Reports.

Table V. shows the causes of Death classified under appropriate heads. This form is adopted from the Reports of the Commissioners in Lunacy for Scotland, with some addition and modification. It appears sufficiently detailed for statistical purposes.

Table VI. gives the length of residence in the Asylum of those discharged recovered, and of those who died during the year.

Table VII. shows the duration of the disorder on Admission, in the Admissions, Discharges, and Deaths, during the year.

Table VIII. shows the Ages of the Admissions, Discharges, and Deaths, during the year.

Table IX. shows the condition as to Marriage in the Admissions, Discharges, and Deaths, during the year.

Table X. shows the probable causes, apparent or assigned, of the disorder, in the Admissions, Discharges, and Deaths, during the year.

Table XI. shows the form of mental disorder, in Admissions, Discharges, and Deaths, during the year.

Tables XII., XIII., XIV., show respectively, the Education, Occupations, and Religious Persuasions of those admitted during the year.

Reference to these Tables show the chief particulars relating to the Admissions, Discharges, and Deaths, during the year. A brief analysis may not be uninteresting.

#### ADMISSIONS.

The increase in the number of Admissions has been as extraordinary as unexpected, amounting to 230 during the year, (103 males and 127 females), being an increase of 63 over the previous year, and in excess of any year since the opening of the Asylum.

In the 1st Quarter were Admitted 71 Cases; 35 Males, 36 Females.									
"	2nd	"	"	"	53	"	26	"	27
"	3rd	"	"	"	55	"	23	"	32
"	4th	"	"	"	51	"	19	"	32
					<u>230</u>			<u>103</u>	<u>127</u>

#### DISCHARGES.

The proportion of Recoveries has been unusually high, and above the average of County Asylums, being for the males 45·6, and for the females 54·3 per cent on the Admissions. During the year, 135 cases have been Discharged, 54 males, 81 females; of these 47 males, and 69 females have been Discharged Recovered.

RECOVERED.				RELIEVED.			NOT IMPROVED.			
		Males	Fem.	Total	Males	Fem.	Total	Males	Fem.	Total
1st Quarter	...	11	11	22	3	1	4	...	...	...
2nd	„	12	19	31	2	4	6	1	...	1

4th	„	10	17	27	1	4	5	...	1	1
		<hr/>	<hr/>	<hr/>	<hr/>	<hr/>	<hr/>	<hr/>	<hr/>	<hr/>
		47	69	116	6	11	17	1	1	2

#### DEATHS.

The mortality has not been essentially different from the average, being 72, or 10·6 per cent. both sexes, on the average numbers resident. It was as usual highest among the males. A large number of cases have unfor-

tunately been admitted in a painfully unsatisfactory state; sent simply to die, and who only survived a few days. These cases have arrived in various stages, from well pronounced organic disease to extreme old age.

In the 1st Quarter there were 21 Deaths; 12 Males, 9 Females.									
„	2nd	„	„	„	20	„	11	„	9
„	3rd	„	„	„	14	„	8	„	6
„	4th	„	„	„	17	„	9	„	8
					<hr/>			<hr/>	<hr/>
					72			40	32

In the month of May, one man committed suicide by hanging; an inquest was held, the particulars of which were sent to the Commissioners in Lunacy.

#### AMUSEMENTS AND OCCUPATIONS.

Nothing has been omitted in order to provide for the usual amusements of the patients. During the winter and spring, several dramatic performances and concerts were given. At these entertainments some of the most excitable patients have been present, and the results have been so encouraging, that in future no patients of this class will be prevented from attending them. Their conduct has uniformly been orderly and decorous. During the summer, “cricket” formed the chief attraction. Several matches were played during the season, in which the patients invariably took a part. At this period also, a large number of patients of both sexes were employed in harvesting.

During the autumn, “football,” and “rounders,” formed the chief out-door amusements. Walking parties have been regularly organised, ranging generally from twice to three times a week. The weekly dances have been held as usual, and the band continues to play at dinner in the dining-hall every Thursday. Owing to the liberality of the Committee, the number of books, newspapers, and illustrated periodicals have been increased. Dominoes, draughts, cards, and various other sources of amusement have been added.

On reference to the industrial branch of the Asylum,

it will be seen from the subjoined table, compiled from the weekly "Medical Register," that a large number of patients are engaged in useful occupations. The agricultural class as usual employed upon the farm and garden. The artisans in the different workshops, as blacksmiths, carpenters, cabinet makers, painters, plumbers, shoemakers, tailors, upholsterers, besides many others working at the quarry and limekiln, helping the masons or otherwise engaged in assisting the attendants in domestic duties. Extra workshops have also been recently provided for patients, suitable to their individual handicraft.

A large proportion of the female patients have likewise been employed. Plain and fancy needlework giving occupation to a considerable number, whilst others have been at work in the laundry and kitchen, as also assisting attendants, and so performing ordinary household duties. The School long established on both sides of the house continues in good working order. Arrangements are made for reading, writing, spelling, and the elementary rules of arithmetic. Bible classes are also formed under the direction of the Chaplain.

TABLE SHOWING THE CLASSIFICATION OF PATIENTS.

Male Department Numbers 230.				Female Department Numbers 301.			
In the Infirmary	..	..	34	In the Infirmary	..	..	36
Employed	..	..	151	Employed	..	..	180
Unemployed	..	..	45	Unemployed	..	..	85

It will thus be seen, that excluding those under medical treatment in the Infirmarys, nearly three-fourths of the patients are industriously engaged.

Little need here be said on the beneficial results of mechanical occupations for the insane. They are advantageous to the Asylum, and profitable to the patients, even by diminishing the tedium of residence. The profit that accrues, rests not alone, however, on financial grounds (as illustrated by reduction in the cost of maintenance dependent on home production), but as furnishing a highly remedial agent in the hands of the Physician towards cure.

To turn, however, to the darker side of the picture, it will be seen that a large number are returned as "unemployed." These consist partly, of those advanced in years, the epileptics, and the idiots. Much, however, can still be done even with such apparently incurable cases as the idiots; and although very little hope can be entertained of much mental restoration, they should not be considered utterly incapable of improvement. By means of judicious occupation and recreation, we may protect them from lapsing into a deeper state of degradation.

Regarded too often by the external world as almost an insult to the human race, the bodily form occasionally presenting painful evidences of arrest of development, the idiot stands but a poor chance in the race of life. Although metaphysical doubts have been raised as to the possibility of distinguishing some idiots from monkeys, the dignity of the human race being so often compromised by mimetic and simious follies, still the idiot never reverts to the type of an animal. Any supposed approximation of this race of mankind to inferior organizations as the anthropoid apes, is as unphilosophical as it is untrue. The line of demarcation between the idiot and the animal is unerringly marked.

The fate of our idiotic fellow-creatures is therefore deserving our most ardent sympathy and support, and should induce more humane efforts on their behalf. Too often a burden on a struggling family, they are consigned at a tender age to the workhouse, thence to be transferred, because troublesome, to the Asylum. Valuable time is thus lost in developing their better qualities. The workhouse is certainly not the place to keep them. Cruelly treated often at home, it is painful to say, they fare little better in the workhouse. Cases have been received into the Asylum of idiots at a very young age, (eleven years), in an extremely emaciated condition, and with bed-sores on admission. It is indeed very questionable whether such cases ought to be sent to the Asylum at all. The mixture of idiots and lunatics in large institutions reacts unfavourably on both.

There are at present in the Asylum 52 idiots, 35 males, 17 females. Different methods of employment have been tried amongst them, and some attend the school which is held three times a week. It forms a variety for them, but they cannot receive that undivided attention which the necessity of the case demands. Much can be done to improve their bodily health, and every Physician will still regard them as objects deserving his deepest commiseration. Though constituting the weakest branches in the great tree of humanity, they will not the less receive his diligent and tender care.

#### MEDICAL TREATMENT.

The treatment of the medical and surgical cases has been conducted on the same principles observed in ordinary hospital practice. In cases of acute mania with severe thoracic complications, ever bearing in mind the asthenic nature of the malady, care has been taken to give stimulants early, to meet the exhaustion arising from the untoward combination. In this way sedatives as digitalis, have been successfully employed in combination with ammonia, chloric ether, and tincture of bark.

In other cases again, the treatment has been chiefly dietetical, and to an outside observer might appear hardly fitted for the Infirmary wards, or at all events it might have been safely delegated to the nurse in the ordinary wards; but inasmuch as the treatment throughout was carried out on strictly physiological principles, it may be classed under the head of medical treatment.

So far from deprecating the value of drugs in the treatment of insanity, a glance at the Prescription Books would show the variety of medicines employed in the different Infirmary wards. Still as opinions are so contradictory on many medical subjects, it is not to be wondered that a certain reticence should be observed regarding the difficulties involved in the practice of psychological therapeutics.

Take a disease epilepsy. There are no less than 83 epileptics in the Asylum. The whole strength of the

Pharmacopœia has been drawn on these cases, and different remedies alone or in combination, suggested by some of the most eminent physicians of the day, have been tried in turn, and have proved nearly equally unsuccessful. Perhaps the bromide of potassium may have yielded better returns for a time as regards the duration or severity of the epileptic seizures. There is no doubt that counter-irritation is of value in some of these cases of epilepsy, and every physician must have felt the difficulty of combating at once the head and chest symptoms so painfully prominent in a severe attack. On the principle of relieving congestion of the lungs, unfortunately a too fatal concomitant of epileptic fits, cupping applied to the chest has been of service.

#### ALTERATIONS AND IMPROVEMENTS.

Several minor alterations in progress during the last year are now completed. Additional bath-rooms have been provided, and printed rules suspended for the guidance of the attendants. Each patient is twice a week thoroughly washed in warm soap and water, and each patient is bathed in a fresh supply of water. The temperature of the water is regularly tested by a thermometer. The body linen of the patients is changed also twice a week.

Numerous additions have moreover been made to the wards, by placing in them a larger supply of objects of interest, as pictures, birds, statuettes, plants, &c. Coloured vallances have likewise been fixed in all the windows, both of corridors and day rooms. Number 3, the so-called refractory ward has been similarly furnished, and the greatest success has followed the experiment. In no instances have any of the objects of ornament been injured by the patients. Some little additions in the shape of embellishments have also been effected at the detached hospital. This auxilliary building, while serving for isolation should unfortunately any epidemic occur disembarasses the parent house of many chronic cases.

The new West Wing is now ready for occupation.

Amongst the changes that have occurred during the year, may be mentioned the death of the Dairy Woman. She had been here since the opening of the Asylum. She died in the summer, of gastric and uterine disease.

The Head Attendant on the male side has also been removed by death. He too had been in the establishment since its opening. He died quite recently of dropsy.

The Medical Superintendent cannot close his Report without adverting to the retirement of Dr. BOYD last summer. He had the pleasure whilst holding the subordinate capacity of Assistant Medical Officer of working with him for eight years in uninterrupted harmony. Dr. BOYD's constant aim was directed to the enjoyments and creature comforts of the patients committed to his charge. The many structural alterations and improvements effected by him have ever been designed with a due regard to sanatory requirements. This speaks sufficiently well for itself, as since the opening of the Asylum in 1848, no disease of any epidemic character has occurred. Although the close connection for upwards of twenty years existing between the Committee and Dr. BOYD is officially severed, they may rest assured that he will ever continue to take the deepest interest in the management of the Asylum, and to offer suggestions in every way calculated for the benefit of the patients.

In conclusion, the Medical Superintendent begs to return his most grateful acknowledgments to the Committee, for the confidence and support tendered him, in the discharge of his arduous and responsible duties.

# REPORT OF THE CHAPLAIN,

1868.

---

*To the Visiting Justices of the Somerset County Lunatic Asylum.*

Gentlemen,

It is customary for the Chaplains of other Asylums to present an Annual Report of their work, and I venture to think that the present is an appropriate time for me to follow their example.

On entering upon my duties as your Chaplain, I was required "to conduct Divine Service every day, and to preach at least one sermon on Sundays, Good Friday, and Christmas Day." I am happy to say that during the past year I have been able to perform these duties personally; excepting when absent ten days on leave, and once or twice when suffering from indisposition. On the former occasions the duties were kindly undertaken by the Incumbent and the Curate of Horrington.

Since the erection of the Hospital, the patients being unable to attend morning service on week days, I have thought it my duty to hold a service there at least once a week.

I have a Bible class for female patients weekly, and have recently held an evening service and given a lecture, on the male side, in the reading room. The attendance on either side varies from forty to seventy, and the decorum that prevails during, and the interest that is evinced in, these portions of my labours, are very encouraging.

During the winter months I have a Bible class combined with a night school for the female attendants.

I visit the wards and infirmaries nearly every day—in special cases twice a day—and take every opportunity that presents itself to my notice of speaking a “word in season” to those whose spiritual interests are committed to my charge.

During the course of the year I have solemnised fifty-four funerals.

With the sanction of Dr. Boyd, and subsequently of Dr. Medlicott, instruction in reading, writing, and arithmetic is given during three mornings of the week. I take the same part in this that I should be expected to take in parish schools—visiting them regularly, teaching occasionally, encouraging the patients to attend, and interesting myself in their progress. The principle on which they are conducted “that the choice of pupils likely to be benefitted by instruction, should be solely in the hands of the Medical Superintendent,” is obviously an essential one. As to the value of the classes in a curative point of view, a physician is the best judge; but I may say, apart from this, that they are highly prized by some of the patients as varying the monotony of their life, while the instruction afforded by them may be of use in the future to those who recover.

I have also endeavoured to assist your Superintendents, and at their request, in directing the distribution of the magazines, newspapers, and books which you from time to time provide. The average number lent every week is about sixty; and I may take this opportunity of stating that in answer to my applications, your grants have been supplemented by the “Society for Promoting Christian Knowledge,” the “Bible Society,” and within the last month, by the “Religious Tract Society.” The books are lent to attendants as well as patients, and their influence is, undoubtedly, good.

How far my labours, so far as they are of a spiritual nature, are beneficial, it is of course impossible to say. Considering that 135 patients have been discharged as partially or completely cured, and that 72 died, some of

whom have been capable of receiving the consolations of religion; and adding to these facts the probability, that, out of five hundred patients, there are at least between one and two hundred who are conscious of moral obligations, I cannot fail to believe that, amid much that is peculiarly discouraging, some few have profited from my ministrations—a belief that is strengthened by as many assurances to that effect as I have received in more honored and prominent posts of duty.

And in closing my report, may I venture to add that the erection of the contemplated Chapel will promise materially to increase the efficiency of your Chaplain's labours. The choking sensations caused by a crowded and ill-ventilated room, the difficulty of a reverent attitude in divine worship, the disturbances now necessarily occasioned by the removal of noisy and convulsed patients, the inadequacy of accommodation for a choir, and for resident officials, attendants, and their families, and the utter impossibility of properly celebrating the Holy Communion, will then be evils mitigated, if not entirely removed, while the services of the Almighty will not be out of harmony, as they now are, with the prevailing tastefulness and efficiency of other arrangements in the establishment.

I cannot conclude without acknowledging gratefully whatever encouragement I have received from yourselves, Dr. Boyd, and Dr. Medlicott, with other officers and attendants, whom it might be invidious to mention.

I have the honor to be,

Gentlemen,

Your obedient servant,

EDWIN GODSON,

*Chaplain.*

The Sick throughout the establishment are dieted at the discretion of the resident Physicians. Extra diet for the Sick:—Arrow-root, Bacon, Beef Steak, Beef Tea, Cat's Foot Jelly, Eggs, Essence of Beef, Milk, Mutton Chop, Rice Pudding, Sago, Soup, Ale, Porter, Brandy, Gin, Port, Sherry. At 11 a.m. the Working Patients have each 2 ozs. Bread, 2 oz. Cheese, and half-pint Beer or Cider; at 4 p.m. ditto.

The Laundry Patients have half-pint Tea. Tobacco and Snuff given to the Working Patients. The Coffee is made by boiling 6 lbs of Ground Coffee with 6 lbs of Sugar, in 32 gallons of Water for ten minutes, to which is added 2 1/2 gallons of New Milk. The Tea is made by substituting 2 lbs of Tea for 6 lbs of Coffee. The Broth for Breakfast is made from 32 gallons of the water in which the Meat had been boiled the previous day, 8 gallons of Milk, 10 lbs of Onions, 2 lb of Salt, 20 lbs of Flour, and 4 ozs of Pepper. The Stew is made by boiling the Bones (which are pounded) for seven hours in 36 gallons of Water, with the addition of 30 lbs of Flour, 5 Shins and 16 lbs of Stickings of Beef, 12 lbs Rice, 2 1/2 lb Pepper, 2 1/2 lbs Salt, 6 sticks of Celery, a bunch of Sweet Herbs, 3 pecks of Onions, some white Cabbages, and a few Potatoes, or Jerusalem Artichokes. This quantity is sufficient for 400 persons.
